

CASE STUDY

Typical 1980s large 4 bedroom in Norfolk

Another customer has seen the light!

Another Eco Design Lot 20 heating installation in a typical 1980s large 4 bedroom build previously heated by an assortment of storage heaters, panel heaters and a couple of supplemental fan heaters for "when it got cold in the evenings".

The old heaters were stripped out and disposed of and 12 of Intelli heat's Cali Eco Sense radiators fitted, this full installation was all completed in one day.

The total heating load removed was in excess of 26kW of inefficient heating. The Cali Eco Sense design for the building has a total heating load of 14kW.

With the easily adjusted programmer, their accurate thermostats, presence detection and open window detection this installation has huge efficiency gains from the start.

After a couple of days of use during a cold snap in February the customers are already reporting a massive improvement in the comfort of their house.
